

Architectures for Optical Burst Transport Networks - A View Beyond QoS -

Christoph Gauger
gauger@ikr.uni-stuttgart.de
christoph@cgauger.de

HHI-Kolloquium
Berlin, 4. April 2006

Trends and Motivation

Internet emerged as the global platform for communication

- Sustained traffic growth due to fixed/mobile broadband access
 - Migration towards optical metro and core networks
- Highly dynamic and asymmetric traffic profiles
 - Flexible packet transport
- Next generation networks demand quality of service QoS
 - Support from transport networks

OBS proposed as long-term IP-over-WDM solution

- Scientific work centers around QoS of OBS-only scenarios
- Few realization and scalability evaluations
 - How to find optimal architectures combining QoS and realization arguments?
- Missing evolution link to existing wavelength-switched networks
 - How to build burst-switched networks on wavelength-switched networks?

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 2, 5.4.06, HHIPres2.fm

Outline

- **Optical burst switching architecture**
 - Introduction and functional components
 - Contention resolution for high QoS
 - Integrated evaluation including realization and scalability
- **OBS meets wavelength-switching**
 - Motivations for virtual topology
 - Key trade-offs and realizations
- **Optical Burst Transport Network (OBTN)**
 - Network and node architecture
 - Performance evaluation

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 3, 5.4.06, HHIPres2.fm

Optical Burst Switching

- **Burst assembly in edge node:**
IP packets → optical bursts
- **One-way signaling**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 4, 5.4.06, HHIPres2.fm

Optical Burst Switching

- **Burst assembly in edge node:**
IP packets → optical bursts
- **One-way signaling**
- **Separation of control and data**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 5, 5.4.06, HHIPres2.fm

Optical Burst Switching

- **Burst assembly in edge node:**
IP packets → optical bursts
- **One-way signaling**
- **Separation of control and data**
- **Fast optical burst switch with fiber delay line buffer (FDL)**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 6, 5.4.06, HHIPres2.fm

OBS Functional Components

- Burst assembly**: assembly of client layer data into bursts
- Burst reservation**: end-to-end burst transmission scheme
- Burst scheduling**: assignment of resources in **individual nodes**
- Contention resolution**: reaction in case of burst scheduling conflict

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 7, 5.4.06, HHIPres2.fm

Universität Stuttgart

Contention Resolution

- Wavelength domain – wavelength conversion**
 - very effective as all WDM channels shared among all bursts
 - but: low burst loss probabilities only for $\geq 100 \lambda s$
 - additional schemes necessary
- Time domain – buffering**
 - simple fiber delay lines (FDLs) in nodes
 - no random access functionality
 - FDL operated in WDM
 - prioritized reservation of buffered bursts with JET possible
- Space domain – deflection/alternative routing**
 - uses entire network as resource for contention resolution
 - additional network load due to detours → positive feedback

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 8, 5.4.06, HHIPres2.fm

Universität Stuttgart

OBS Node with FDL buffer

- Recirculation buffer**
 - Shared per node
 - Coordinated scheduling

- Degenerate Buffer**
 - FDLs in buffer: F
 - wavelengths per FDL: w
 - total number of ports: $P = F \cdot w$
 - delay granularity: D

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 9, 5.4.06, HHIPres2.fm

Universität Stuttgart

FDL Buffer Performance

4x4 switch
16λ/port

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 10, 5.4.06, HHIPres2.fm

Universität Stuttgart

FDL Buffer Performance

- Increasing the number of wavelengths improves QoS

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 11, 5.4.06, HHIPres2.fm

Universität Stuttgart

FDL Buffer Performance

- Different buffer configurations with same P yield comparable performance
- select the configuration based on realization arguments

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 12, 5.4.06, HHIPres2.fm

Universität Stuttgart

FDL Buffer Performance

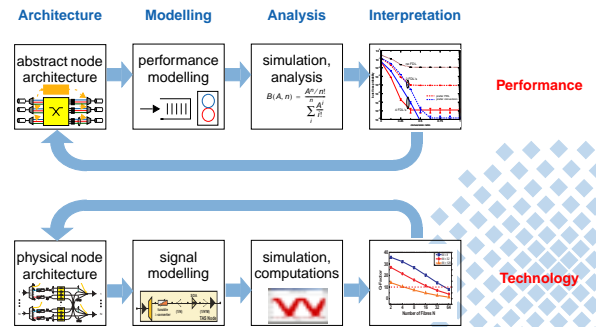

- **Few ports:** different buffer configurations with same P yield comparable QoS
→ select the configuration based on realization arguments
- **Many ports:** QoS depends on buffer configuration
→ further evaluate QoS and realization trade-off

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 13, 5.4.06, HHIPres2.fm

Universität Stuttgart

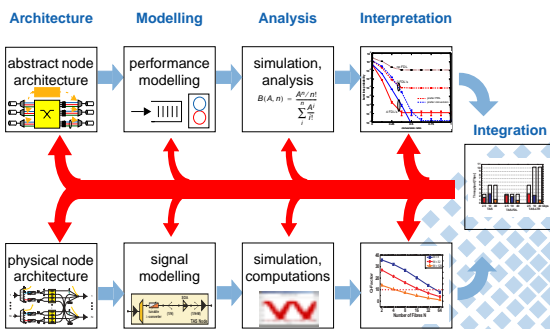

Integrated Evaluation

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 14, 5.4.06, HHIPres2.fm

Universität Stuttgart

Integrated Evaluation

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 15, 5.4.06, HHIPres2.fm

Universität Stuttgart

Tune-and-Select Architecture (TAS)

proposed by H. Buchta, E. Patzak, J. Santer, HHI ITG 2002, ECOC 2002

- **Single-stage switching matrix**
- **Non-blocking**
- **Full wavelength conversion**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 16, 5.4.06, HHIPres2.fm

Universität Stuttgart

Node Parameters

Impact on performance

- **Number of fibers N**
- **Number of wavelengths per fiber M**
- **Contention resolution scheme**

Impact on signal

- **Splitting loss: 1/N, 1/NM**
- **Noise of SOA and EDFAs**
- **Crosstalk**
- **Power loss**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 17, 5.4.06, HHIPres2.fm

Universität Stuttgart

TAS with FDL Buffers

dedicated FDLs: TAS-dFDL

- **Performance Improvement**
- due to buffering
- TAS-shFDL: multiple FDLs

shared FDL buffer: TAS-shFDL

- **Signal Degradation**
- due to increased splitting loss
- due to loss in FDL

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 18, 5.4.06, HHIPres2.fm

Universität Stuttgart

Evaluation Methodology

1. Analysis of signal degradation between two regeneration points

- TAS-shFDL: node-to-node path is critical signal path
- maximum number of wavelengths per fiber M_{\max}
- maximum throughput

2. Simulation of OBS node using M_{\max}

- utilization for a given tolerable burst loss probability P_{loss}
- effective throughput

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 19, 5.4.06, HHIPres2.fm

Universität Stuttgart

Maximum Throughput

- Maximum throughput always between 2 and 6 Tbps
- Greatest for TAS and smallest for TAS-dFDL
- More FDLs in TAS-shFDL yield smaller nodes

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 20, 5.4.06, HHIPres2.fm

Universität Stuttgart

Effective Throughput

- Effective throughput between 1.5 and 4 Tbps
- FDL buffers improve utilization
- More FDLs lead to better utilization but also to smaller nodes
- some TAS-shFDL yield lower effective throughput than TAS

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 21, 5.4.06, HHIPres2.fm

Universität Stuttgart

Outline

- Optical burst switching architecture**
 - Introduction and functional components
 - Contention resolution for high QoS
 - Integrated evaluation including realization and scalability
- OBS meets wavelength-switching**
 - Motivations for virtual topology
 - Key trade-offs and realizations
- Optical Burst Transport Network (OBTN)**
 - Network and node architecture
 - Performance evaluation

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 22, 5.4.06, HHIPres2.fm

Universität Stuttgart

Wavelength Switching

- Transports packets in lightpaths
- Two-way signaling based on ASON, GMPLS, "lambda grid"

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 23, 5.4.06, HHIPres2.fm

Universität Stuttgart

Wavelength Switching

- Transports packets in lightpaths
- Two-way signaling based on ASON, GMPLS, "lambda grid"
- Slow optical cross-connect
- Used to provide virtual topology

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 24, 5.4.06, HHIPres2.fm

Universität Stuttgart

OBS meets Wavelength Switching

- **Optical burst switching (OBS)**
 - Fine-grain statistical multiplexing
- **Wavelength switching**
 - Coarse-grain provisioning and recovery
 - Mature technology → inexpensive bandwidth
- **OBS is often proposed to replace wavelength-switched core networks**
 - **But:** lambda grids are well-suited for core transport networks
 - **But:** high aggregation does not require fine-granular statistical multiplexing

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 25, 5.4.06, HHIPres2.fm

Universität Stuttgart

OBS meets Wavelength Switching

- **Optical burst switching (OBS)**
 - Fine-grain statistical multiplexing
- **Wavelength switching**
 - Coarse-grain provisioning and recovery
 - Mature technology → inexpensive bandwidth
- **OBS is often proposed to replace wavelength-switched core networks**
 - **But:** lambda grids are well-suited for core transport networks
 - **But:** high aggregation does not require fine-granular statistical multiplexing

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 26, 5.4.06, HHIPres2.fm

Universität Stuttgart

➔ **Intelligent combination instead of rapid replacement**

Motivations for Virtual Topology

- **First introduction of burst techniques more likely in MANs**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 27, 5.4.06, HHIPres2.fm

Universität Stuttgart

Motivations for Virtual Topology

- **First introduction of burst techniques more likely in MANs**

➔ **Need for efficient burst transport across core network**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 28, 5.4.06, HHIPres2.fm

Universität Stuttgart

Motivations for Virtual Topology

- **First introduction of burst techniques more likely in MANs**

➔ **Efficient burst transport across core network**

- **Cost of switching dominates cost of transport**
- **Reduction of node size becomes a primary concern**
- ➔ **Bypass intermediate nodes to reduce transit traffic**

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 29, 5.4.06, HHIPres2.fm

Universität Stuttgart

Virtual Topology Trade-offs

Sparsely meshed
e.g. virtual = physical topology

- high stat. mux gain
→ high link utilization
- high transit traffic

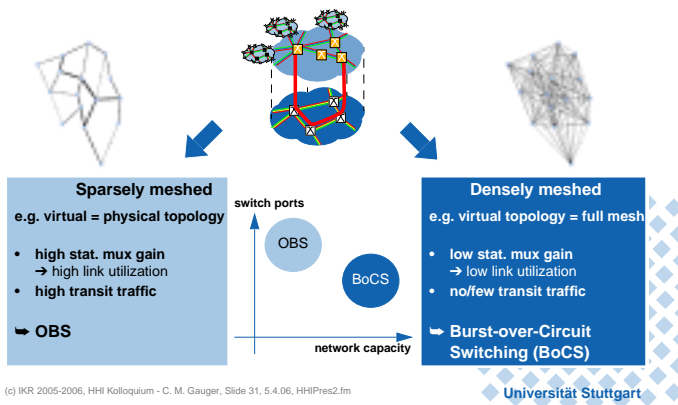

➔ **OBS**

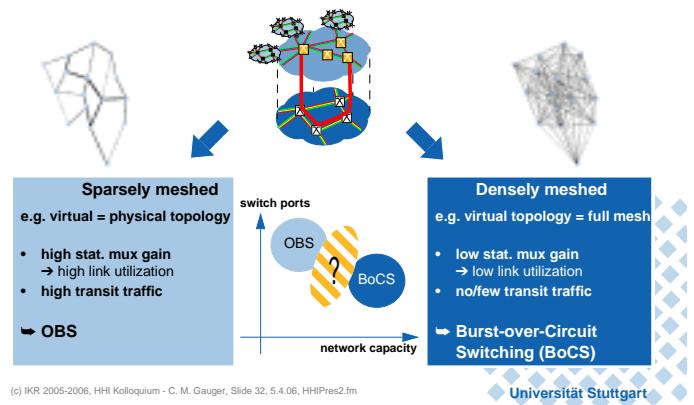

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 30, 5.4.06, HHIPres2.fm

Universität Stuttgart

Virtual Topology Trade-offs

Virtual Topology Trade-offs

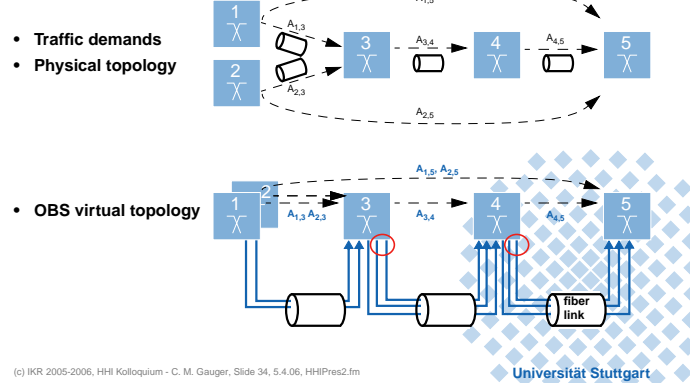

Outline

- Optical burst switching architecture**
 - Introduction and functional components
 - Contention resolution for high QoS
 - Integrated evaluation including realization and scalability
- OBS meets wavelength-switching**
 - Motivations for virtual topology
 - Key trade-offs and realizations
- Optical Burst Transport Network (OBTN)**
 - Network and node architecture
 - Performance evaluation

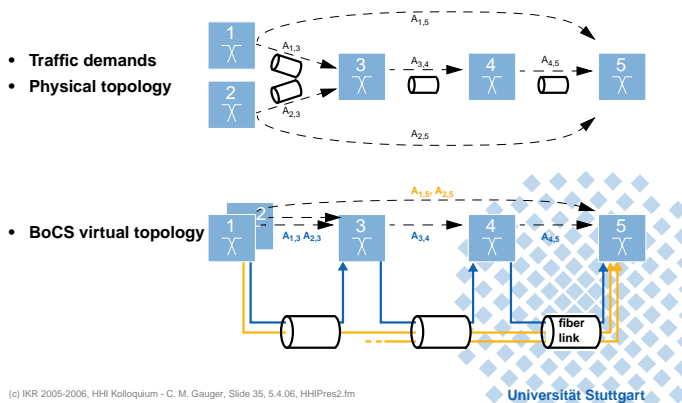

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 33, 5.4.06, HHIPres2.fm

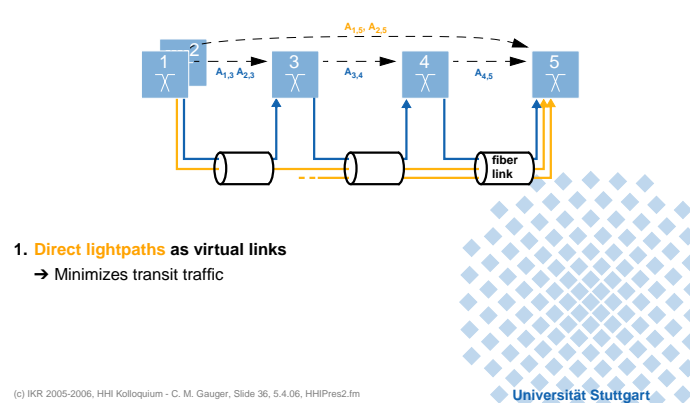

Optical Burst Transport Network (OBTN)

Optical Burst Transport Network (OBTN)

Optical Burst Transport Network (OBTN)

Optical Burst Transport Network (OBTN)

1. **Direct lightpaths** as virtual links
2. **Constrained alternate routing** along fiber links of primary route
→ Resolves contention without route length variation

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 37, 5.4.06, HHIPres2.fm

Universität Stuttgart

Optical Burst Transport Network (OBTN)

1. **Lightpaths** as multi-hop virtual links
2. **Constrained alternate routing** along fiber links of primary route
3. **Shared overflow capacity** compensates for traffic on alternate routes
→ Improves statistical multiplexing as aggregated on few single-hop virtual links

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 38, 5.4.06, HHIPres2.fm

Universität Stuttgart

Optical Burst Transport Network (OBTN)

1. **Lightpaths** as multi-hop virtual links
2. **Constrained alternate routing** along fiber links of primary route
3. **Shared overflow capacity** compensates for traffic on alternate routes
4. **Effective contention resolution**
→ Achieves high QoS and utilization

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 39, 5.4.06, HHIPres2.fm

Universität Stuttgart

OBTN Node View

- OBTN node realized like OBS node (e.g. TAS, BAS, AWG, ...)

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 40, 5.4.06, HHIPres2.fm

Universität Stuttgart

Unified Modeling of Architectures

Resource metrics

- Number of ports in burst-switched nodes
- Number of fiber hops in physical network

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 41, 5.4.06, HHIPres2.fm

Universität Stuttgart

Performance Evaluation

- **European reference topology as core network**
 - 16 nodes
 - 23 links in physical topology
- **Optical MANs abstracted as traffic sources**
- **Traffic**
 - Population-based demand model, approx. 10 Tbps
 - Poisson arrivals
 - Exponential burst transmission time, mean $h = 10\mu s$
- **FDL buffer**
 - Single FDL using WDM with 32 wavelengths
 - Delay of 4 mean burst transmission times

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 42, 5.4.06, HHIPres2.fm

Universität Stuttgart

QoS Comparison

- BoCS requires much higher overprovisioning than OBS

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 43, 5.4.06, HHIPres2.fm

QoS Comparison

- BoCS requires much higher overprovisioning than OBS
- OBTN in between BoCS and OBS
 - β : shared overflow capacity allocation is very effective

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 44, 5.4.06, HHIPres2.fm

QoS Comparison

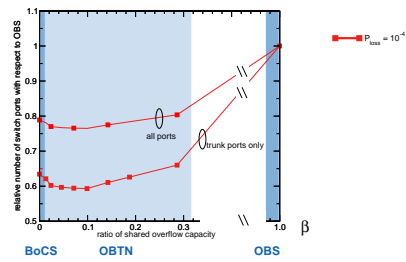

- BoCS requires much higher overprovisioning than OBS
- OBTN in between BoCS and OBS
 - β : shared overflow capacity allocation is very effective
- ➔ Further resource studies for defined QoS criteria

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 45, 5.4.06, HHIPres2.fm

Number of Switch Ports

- OBTN requires fewest number of ports – trunk and overall
- Small β already effective \rightarrow few shared overflow capacity

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 46, 5.4.06, HHIPres2.fm

Number of Switch Ports

- OBTN requires fewest number of ports – trunk and overall
- Small β already effective \rightarrow few shared overflow capacity
- Robust regarding QoS criterion: $10^{-4} \rightarrow 10^{-5}$

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 47, 5.4.06, HHIPres2.fm

Node and Network Resources

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 48, 5.4.06, HHIPres2.fm

Node and Network Resources

OBNTN achieves

- Reduced number of burst-switched ports regarding OBS and BoCS
- Penalty in number of wavelength hops compared to regular OBS
- ➔ Overall cost reduction honoring cost structure

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 49, 5.4.06, HHIPres2.fm

Universität Stuttgart

Alternative OBNTN Virtual Topologies

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 50, 5.4.06, HHIPres2.fm

Universität Stuttgart

Alternative OBNTN Virtual Topologies

Alternative virtual topology design

- Path length-based
- Demand-based
- Combined

➔ Less densely-meshed virtual topologies in OBNTN feasible

- slightly less fiber hops
- slightly more switch ports

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 51, 5.4.06, HHIPres2.fm

Universität Stuttgart

Conclusions

- FDL buffers effectively resolve contention
 - ➔ Low burst loss probability at high channel utilization
- Additional ports to be considered in integrated evaluation of scalability
 - ➔ Buffer has significant impact regarding signal degradation
 - ➔ Few or no improvement regarding the maximum effective throughput

- Motivations and key trade-offs for burst transport with virtual topology
- Optical Burst Transport Network (OBNTN) architecture introduced
- Unified resource modeling of OBS, BoCS, and OBNTN

- Performance and resource evaluation for OBNTN
 - ➔ Yields overall high quality of service
 - ➔ Reduces switch ports with limited penalty in network capacity compared to OBS
- ➔ Overall reduction of resource requirements

(c) IKR 2005-2006, HHI Kolloquium - C. M. Gauger, Slide 52, 5.4.06, HHIPres2.fm

Universität Stuttgart

Outlook

Integrated performance and technology analysis

- Broader application in projects
- Provide simplified models for non-experts

Further OBNTN modeling and evaluation

- Optimal virtual topology design
- Extend resource studies to technological scalability analyses
- Control plane issues
- Migration scenarios for OBS: performance, technology, control, business ...

Research on photonic networks and systems: We should ...

- ... narrow the gap between technology, systems, networks, and applications
- ... also build the stuff, lots of activities in Asia
- ... watch the research networks community
